

# DeepSight Toolkit 6.4.1

## What's new?

- **Powered by the new DeepSight SDK 0.12**
- **New Mask Detector feature**
- **Fixes: image rotation update, 'Smile' visualization fix**

DeepSight Toolkit 6.4.1, your trusted crowd analytics tool now with Face Mask detection.

For this release we are proud to present the new face mask detector feature, designed to help you and your customers adapt to the "new normal".

The mask detector is robust and highly versatile, suitable for both access control and crowd analysis scenarios.

For crowd analysis we provide an aggregated binary (1 or 0) face mask value for each detected person.

The raw data output which reports a confidence score between 0 and 1 can be used for real-time access control.

The confidence float value allows you to customize how strict the threshold for face masks should be in your access control set up.
